

Key Takeaways

Chrome Dev Tools

Use Google Chrome Dev Tools to identify a section or element on a web page. You will find the name of the element ID or class, which you can find in your HTML or CSS code after.

How: Right click on the element, then “Inspect Element”

Find Something In Your HTML or CSS Code

After opening the index.html with your text editor of choice (ex: Sublime Text 2), find the code, text, or image you are looking for to replace it.

How: *[On a PC - CTRL + F] [On a Mac - Command + F]*, search for the text, section, or image.

Replace an Image

In your website project folder, find the image you are looking for, duplicate the file, rename it, then edit it in your chosen photo editor to add the new image of your choice.

Hide a Section

Use Chrome Dev Tools to find the section of a website in question. Once you have found the element ID, open the main CSS file for the website (ex: *agency.css* or sometimes called *main.css* or *style.css*). Write the following code, with the appropriate element ID or class name.

example:

```
#about {  
    display: none;  
}
```

example:

```
.clients {  
    display:none;  
}
```

Important note: If you are targeting an entire class, any modifications you make to the class will change for the whole website. So do not use *display:none*; for a class like *.container*, as it will hide many unintended areas of your website.

IconFont - Font Awesome

Use the awesome open-source Font Awesome website to find icons that are appropriate for your needs. Visit <http://fontawesome.github.io/Font-Awesome/icons/> and replace the icon name with the icon of your choice.

example:

Change `<i class="fa fa-twitter">` to `<i class="fa fa-facebook">`

Code Cheat Sheet:

Images

External "Hard" Link

```

```

Image In Website Directory

```

```

Text Link

```
<a href = "http://www.example.com">Link Text</a>
```

Image Link

Put the <a href> and tags around an image

example:

```
<a href = "http://www.example.com"></a>
```
